Super Resolution

Enhance Quality

The goal of this project is to enhance low-resolution images by using super resolution techniques with OpenCV and Python Deep Learning. Low-resolution images can lack details and appear blurry, making them unsuitable for use in certain applications.

Increase Resolution

By using super resolution techniques, we can increase the resolution of these images and enhance their quality, making them more suitable for various applications.

Powered by OpenCV

This project will leverage the power of OpenCV, a popular open-source computer vision library, to implement the super resolution algorithms and achieve the desired image enhancement.
